

Health Summary Report

Patient: ashig
DOB: None
Blood Type: None

Medical History

- Hypertension (managed with Lisinopril 10mg)
- Type 2 Diabetes (managed with Metformin)

Insights from Documents (AI Synthesis)

On March 13, 2026, John Doe presented with symptoms highly suggestive of stable angina pectoris, experiencing persistent sharp sub-sternal chest pain radiating to the left arm, lasting approximately 15 minutes per episode. These episodes are typically triggered by physical exertion and alleviated by rest or sublingual nitroglycerin. His medical history includes managed hypertension and Type 2 Diabetes, with recent lab results indicating an elevated LDL level of 160 mg/dL. Based on these findings, a diagnosis of suspected stable angina pectoris was made. The current plan involves referral for a Stress Thallium test and an adjustment to his Lisinopril dosage.
